Researchers at the University of South Florida have developed a software tool which enables the Department of Transportation Environmental Management Office to systematically document, track and evaluate agency public involvement efforts.

There are many aspects of implementing road construction and other transportation projects. Public opinion is important in determining the need and best strategy to implement such projects. Data collection of surveys taken, looking at the actual businesses and anything that is affected can be an tedious task.

Our researchers have developed the Public Involvement Performance Measurement Tool software that is helpful in automating the now manual system used for collecting, managing, and analyzing this information, which we are sure project managers and senior management will appreciate.

Once information is input into the system it will be securely stored and available allowing reports to be generated from the stored data. Information can be easily and efficiently accessed with the Public Involvement Performance Measurement Tool.

**ADVANTAGES:**

- Designed for collection of transportation data
- Customizable for your specific need
- Faster and user-friendly
- Accurate results

**Data Collection and Assessment Made Easy**
